

Torsion reinforced door frame

When we open a common door sideways, it happens that due to its own weight the door frame bends slightly and twists. This deformation also occurs when a door, that are hung off the gravity centre, is drawn up and down. Under certain circumstances these deformations can lead to a more frequent glass breaking.

That's why we've reinforced the casing of the new fireplace inserts Romotop the Angle series. This causes its maximum stiffness, which minimize the possibility of door deformations resulting in glass breaking.
